Assignment 3

Ergodic Theory

Author: Adam J. Gray

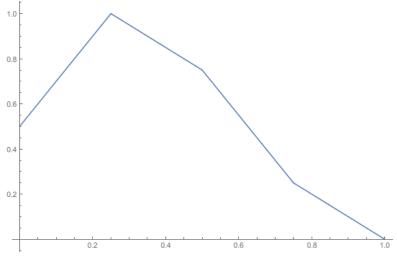

Student Number: 3329798

1

We consider the map

$$T(x) = \begin{cases} 2x + \frac{1}{2} & 0 \le x < \frac{1}{4} \\ -x + \frac{5}{4} & \frac{1}{4} \le x < \frac{1}{2} \\ -2x + \frac{7}{4} & \frac{1}{2} \le x < \frac{3}{4} \\ -x + 1 & \frac{3}{4} \le x \le 1. \end{cases}$$
 (1)

This has the following plot:

1.1

We have that in general

$$\mathcal{P}_T f(x) = \sum_{z \in T^{-1} x} \frac{f(z)}{|T'(z)|}.$$
 (2)

Then in general we have

$$T'(x) = \begin{cases} 2 & 0 \le x < \frac{1}{4} \\ -1 & \frac{1}{4} \le x < \frac{1}{2} \\ -2 & \frac{1}{2} \le x < \frac{3}{4} \\ -1 & \frac{3}{4} \le x \le 1. \end{cases}$$
 (3)

Also we can also see that

$$T^{-1}\{x\} = \begin{cases} \{1-x\} & 0 \le x < \frac{1}{4} \\ \{\frac{7}{8} - \frac{x}{2}\} & \frac{1}{4} \le x < \frac{1}{2} \\ \{\frac{7}{8} - \frac{x}{2}\} \cup \{\frac{x}{2} - \frac{1}{4}\} & \frac{1}{2} \le x < \frac{3}{4} \\ \{\frac{5}{4} - x\} \cup \{\frac{x}{2} - \frac{1}{4}\} & \frac{3}{4} \le x < 1 \end{cases}$$

$$(4)$$

thus for $f_i(x) = \mathbb{1}_{I_i}(x)$ we have that

$$\mathcal{P}_T f_1(x) = \frac{1}{2} \mathbb{1}_{I_3 \cup I_4}(x) = \frac{1}{2} \mathbb{1}_{I_3}(x) + \frac{1}{2} \mathbb{1}_{I_4}(x)$$
 (5)

$$\mathcal{P}_T f_2(x) = \mathbb{1}_{I_4}(x) \tag{6}$$

$$\mathcal{P}_T f_3(x) = \frac{1}{2} \mathbb{1}_{I_2 \cup I_3}(x) = \frac{1}{2} \mathbb{1}_{I_2}(x) + \frac{1}{2} \mathbb{1}_{I_3}(x) \tag{7}$$

$$\mathcal{P}_T f_4(x) = \mathbb{1}_{I_1}(x) \tag{8}$$

1.2

Let $S = \operatorname{span} \bigcup_{i=1}^4 \mathbbm{1}_{I_i}$. Let $f \in S$ then $f = \sum_{i=1}^4 \lambda_4 \mathbbm{1}_{I_i}$ and so by linearity of the Perron-Frobenius operator, we have that $\mathcal{P}_T(f) = \sum_{i=1}^4 \lambda_4 \mathcal{P}_T(\mathbbm{1}_{I_i})$ but from the result above we see that $\mathcal{P}_T(\mathbbm{1}_{I_i}) \in S$ for each i and so \mathcal{P} preserves S

1.3

We do this by just pluging the basis of S into the P_T and putting the results in each row of the matrix. Seeing as we already have first part we can just write down the matrix M as

$$M = \begin{bmatrix} 0 & 0 & \frac{1}{2} & \frac{1}{2} \\ 0 & 0 & 0 & 1 \\ 0 & \frac{1}{2} & \frac{1}{2} & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$
 (9)

1.4

Using Mathematica we can calculate the left eigenvector corresponding to eigenvalue 1 which is

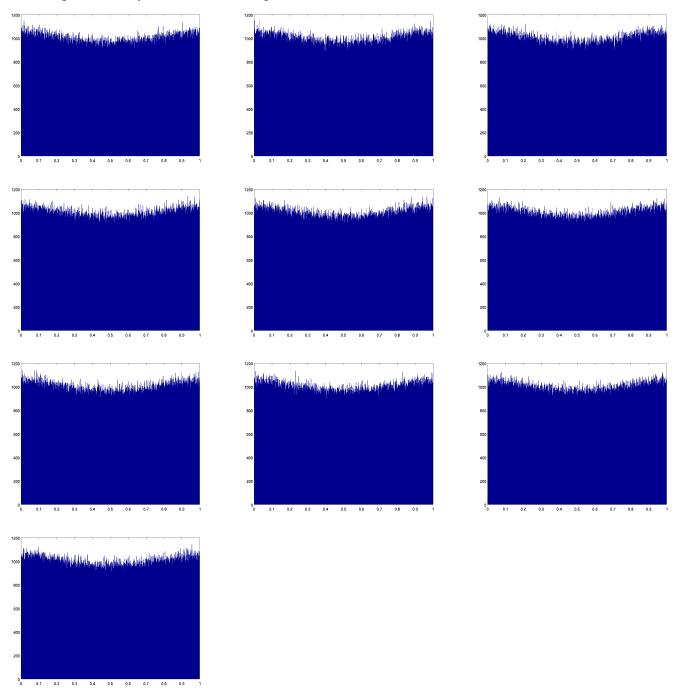

$$\mathbf{v} = (1, \frac{1}{2}, 1, 1) \tag{10}$$

which corresponds to the ACIM (after rescaling)

$$\frac{8}{7} \left(\mathbb{1}_{I_1} + \frac{1}{2} \mathbb{1}_{I_2} + \mathbb{1}_{I_3} + \mathbb{1}_{I_4} \right) \tag{11}$$

2.1

The following plots we produced by code in $Question_2_a.m$ available at https://github.com/adamjoshuagray/Honours_Ergodic_Theory/tree/master/Assignment_3.

What these historgrams show is that TODO

2.2

This code is available in $Question_2_b_c_d.m$ available at https://github.com/adamjoshuagray/Honours_Ergodic_Theory/tree/master/Assignment_3.

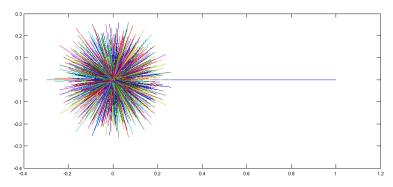

2.3

Show TODO

Note that numerical verification is done in $Question_2_b_c_d.m$ available at https://github.com/adamjoshuagray/Honours_Ergodic_Theory/tree/master/Assignment_3.

2.4

The following is a plot of all the left eigenvalues of Q in the complex plane.

It is clear to see that there is only one eigenvalue equal to 1. We have also checked this in code in $Question_2_b_c_d.m$ available at https://github.com/adamjoshuagray/Honours_Ergodic_Theory/tree/master/Assignment_3.

The following is a plot of the left eigenvector corresponding to the eigenvalue 1.

3

3.1

Now note that $S = h \circ T \circ h^{-1}$ or equivelently $T = h^{-1} \circ S \circ h$.

As h and T are non-singular, so is S and thus by the composition of Perron-Frobenius operators we can write

$$\mathcal{P}_T f = (\mathcal{P}_{h^{-1}} \circ \mathcal{P}_S \circ \mathcal{P}_h) f \tag{12}$$

or equivelently

$$(\mathcal{P}_h \circ \mathcal{P}_T) f = (\mathcal{P}_S \circ \mathcal{P}_h) f.. \tag{13}$$

Now as $\mathcal{P}_h f = g$ and by assumption $\mathcal{P}_T f = f$ then

$$\mathcal{P}_h f = \mathcal{P}_s g \tag{14}$$

but we have also shown that $\mathcal{P}_h f = g$ and so the result follows.

3.2

From the lectures we know that $\mathcal{P}_S g = g$ implies that g is an S invariant density, so the result is immediate. A formal statement of that theorem along with it's proof is as follows

Theorem 1.

Proof. Suppose $\mathcal{P}_S g = g$. Then we can say

$$\int_{A} \mathcal{P}_{S} g d\mu = \int_{A} g d\mu. \tag{15}$$

Further we can say from the definition of the Perron-Frobenius operator that

$$\int_{A} \mathcal{P}_{S} f d\mu = \int_{S^{-1}A} g d\mu \tag{16}$$

and so

$$\int_{A} f d\mu = \int_{S^{-1}A} f d\mu \tag{17}$$

that is g is the density of a S invariant measure defined by

$$\nu(A) = \int_{A} g d\mu. \tag{18}$$

3.3

We wish to show that

$$\int_{I} \log |T'(x)| d\mu_f(x) = \int_{I} \log |S'(x)| d\mu_g(x). \tag{19}$$

Starting from the definition of S we can write

$$\int_{I} \log |S'(x)| d\mu_g(x) = \int_{I} \log |\left(h \circ T \circ h^{-1}(x)\right)'(x)| d\mu_g(x)$$
(20)

$$= \int_{I} \log \left| \left(h \circ T \circ h^{-1}(x) \right)'(x) \right| g(x) d\mu(x) \tag{21}$$

but then using the definition of g we can further write

$$\int_{I} \log |(h \circ T \circ h^{-1}(x))'(x)| g(x) d\mu(x) = \int_{I} \log |(h \circ T \circ h^{-1}(x))'(x)| (f \circ h^{-1})(x) |h^{-1}(x)'| d\mu(x) \tag{22}$$

$$= \tag{23}$$

Now let $y = h^{-1}(x)$ so that $d\mu(y) = h^{-1}(x)'d\mu(x)$ so we have

$$\int_{I} \log |\left(h'(T(y)) \cdot T'(y) \cdot h\right)'(x)| \tag{24}$$

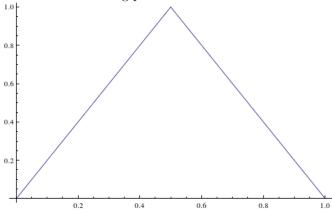

4

4.1

For $T:I\longrightarrow I$ defined as

$$T(x) := \begin{cases} 2x & 0 \le x \le \frac{1}{2} \\ 2(1-x) & \frac{1}{2} < x \le 1 \end{cases}$$
 (25)

we have the following plot:

The T invariant density may be found in much the same way as for question 1. If we let $I_1 = \left[0, \frac{1}{2}\right]$ and $I_2 = \left[\frac{1}{2}, 1\right]$ and choose the basis $\{\mathbb{1}_{I_1}, \mathbb{1}_{I_2}\}$ then the associated matrix representation of the Perron-Frobenius operator is

$$\begin{bmatrix}
\frac{1}{2} & \frac{1}{2} \\
\frac{1}{2} & \frac{1}{2}
\end{bmatrix}$$
(26)

which has eigenvector (1,1) associated with eigenvalue 1 and so the T invariant density is $\mathbb{1}_{[0,1]}$, in other words the density is the uniform density (1).

4.2

We have to do is show that

$$g = (f \circ h^{-1}) | (h^{-1})' | \tag{27}$$

where f is the density of the ACIM associated with T.

Now since f is the uniform density all we have to show is that

$$|(h^{-1})'| = \frac{1}{\pi\sqrt{x(1-x)}}.$$
 (28)

Now since $h(x) = \sin^2(\frac{\pi x}{2})$ we have that $h^{-1}(x) = \frac{2}{\pi}\sin^{-1}(\sqrt{x})$ and by differentiating we see that

$$(h^{-1}(x))' = \frac{1}{\pi\sqrt{x(1-x)}}$$
 (29)

and note that for $x \in [0,1]$ this is positive so

$$|(h^{-1}(x))'| = \frac{1}{\pi\sqrt{x(1-x)}}$$
(30)

The last thing we have to show is that $S(x) = (h \circ T \circ h^{-1})(x)$ or equivelently $T(x) = (h^{-1} \circ S \circ h)(x)$. See that

$$T(x) = \frac{2}{\pi} \sin^{-1}\left(\sqrt{4\sin^2\left(\frac{\pi x}{2}\right)\left(1 - \sin^2\left(\frac{\pi x}{2}\right)\right)}\right)$$
(31)

$$= \frac{2}{\pi} \sin^{-1} \left(\sqrt{4 \sin^2 \left(\frac{\pi x}{2} \right) \cos^2 \left(\frac{\pi x}{2} \right)} \right) \tag{32}$$

$$= \frac{2}{\pi} \sin^{-1} \left(2 \sin \left(\frac{\pi x}{2} \right) \cos \left(\frac{\pi x}{2} \right) \right) \tag{33}$$

$$= \frac{2}{\pi} \sin^{-1} \left(\sin \left(\pi x \right) \right) \tag{34}$$

$$= \begin{cases} 2x & 0 \le x \le \frac{1}{2} \\ 2(1-x) & \frac{1}{2} < x \le 1 \end{cases}$$
 (35)

and so this resolves the problem in that by using the result of Section 3. That is, the density g is S-invariant.

4.3

By using the result of question 3.3 we can calculate the Lyapunov exponent of $(I, \mathcal{B}, \mu_g, S)$ by just calculating the Lyapunov exponent of $(I, \mathcal{B}, \mu_f, T)$. Since we have that f = 1 then we can just write

$$\int_{I} \log |T'(x)| d\mu_f(x) = \int_{I} \log |T'(x)| d\mu \tag{36}$$

$$= \int_0^1 \log 2d\mu \tag{37}$$

$$= \log 2 \tag{38}$$
